Read the passage carefully and answer the questions:

Popular wisdom holds that we can 'rewire' our brains: after a stroke, after trauma, after learning a new skill, even with 10 minutes a day on the right app. The phrase is everywhere, offering something most of us want to believe: that when the brain suffers an assault, it can be restored with mechanical precision. But 'rewiring' is a risky metaphor. It borrows its confidence from engineering, where a faulty system can be repaired by swapping out the right component; it also smuggles that confidence into biology, where change is slower, messier and often incomplete. The phrase has become a cultural mantra that is easier to comprehend than the scientific term, neuroplasticity – the brain's ability to change and form new neural connections throughout life.

The metaphor of rewiring also draws strength from changing theories in developmental neuroscience. The brain was thought to be largely static after childhood, becoming a fixed network of circuits, much like a hardwired radio. But beginning in the 1960s, researchers showed that the brain was far more adaptable. Importantly, while neuroplasticity is a lifelong feature of the brain, it is more robust during youth and becomes more effort-dependent with age.

Plasticity happens throughout life, but it's shaped by many factors: age, environment, repetition, rest, nutrition and emotional state. While neuroplasticity resists shortcuts, it does respond to sustained engagement. Across the lifespan, brains that are challenged – cognitively, socially, physically – tend to retain greater flexibility than those that are not. This is not because any single activity 'rewires' a specific circuit, but because varied, effortful experiences repeatedly recruit overlapping networks: attention, memory, movement, emotion.

Metaphors can motivate, but they can also mislead. The notion that someone can rewire their brain through sheer willpower, self-help books or 10 minutes of daily meditation risks turning serious neurological change into a gimmick. While cognitive behavioural therapy and physical rehabilitation have strong evidence supporting their effects on brain function, these changes occur over time and have biological constraints.

The brain is not a circuit board. Changing it is not as simple as swapping a wire or updating software. The reality of neuroplasticity is far messier: it's a biological process that is incremental and frustratingly slow. And while science does support the idea that the brain can change, it also reminds us that change comes at a cost. It requires time and effort, and sometimes it ends in failure.

When Indian banks struggle, [1] governance, political interference, and poor risk management are the usual explanations. Each contains some [2]. Taken together, however, they miss the [3] issue. Over time, India has asked its banks to bear [4] that, in more mature systems, are priced, traded, and distributed through markets. This has quietly overburdened bank [5] sheets and made the financial system more [6] than it needs to be.

The [7] begins with a structural imbalance. India has built a reasonably [8] government bond market, supported by the Reserve Bank of India and a predictable issuance framework. Government securities outstanding are close to 90% of GDP, comparable to many [9] economies. The same cannot be said of corporate bonds. At around 15%-16% of GDP, India's corporate bond market is less than half the size of China's and [10] a quarter of that in the United States or Germany.
